# حساب الشغل المبذول لغاز مثالي (Work) For ideal gas

الحجم ثابت  $U = \text{Const}$

$$dU = \text{Zero}$$

$$W = \text{Zero}$$

Ex] rigid tank contain air at 500 kPa & 150°C, as result of heat transefer the temperature and pressure drop to 65°C and 400 kPa. Calculate work done during this process ??

∴ Rigid tank

∴ Volume of tank is Constant

$$dU = \text{Zero}$$

$$W = \int_{V_1}^{V_2} P dV = \text{Zero}$$

الضغط ثابت  $P = \text{Const}$

$$W = P \Delta V$$

Ex] piston contain 0.1 mole of water vapour at 20 psia & 320°K, heat is now added to the system and temp reach 400°K, if the pressure was Const determine work done by the system

$$W = P \Delta V = P (V_2 - V_1)$$

$$W = P \left( \frac{nRT_2}{P} - \frac{nRT_1}{P} \right)$$

$$W = nR (T_2 - T_1)$$

$$W = 0.1 \text{ mole} \times \frac{2 \text{ Calory}}{\text{mole}^\circ \text{K}} (400 - 320^\circ \text{K})$$

$$W = 16 \text{ Calory}$$

$P \& V \neq \text{Const}$

الضغط والحجم متغيرين

$$W = nRT \ln \frac{V_2}{V_1}$$

$$W = nRT \ln \frac{P_1}{P_2}$$

Ex] Cylinder contain 0.4 m³ of air at 100 kPa and 80°C, the air is compressed to 0.1 m³ as the temperature remain Constant. Determine work done during this process

$$W = \int_{V_1}^{V_2} P dV$$

$$= \int_{V_1}^{V_2} \frac{C}{V} dV$$

$$= C \int_{V_1}^{V_2} \frac{dV}{V} = C \ln [V]_{V_1}^{V_2}$$

$$= C [\ln V_2 - \ln V_1] = C \ln \frac{V_2}{V_1}$$

$$= P_1 V_1 \ln \frac{V_2}{V_1} = (100)(0.4) \ln \frac{0.1}{0.4}$$

$$W = -55.45 \text{ kPa} \cdot \text{m}^3$$

(Work done by real gas)

لحساب الشغل المبذول لغاز حقيقي

to Calculate the work done by real gas that obey Vander Vall equation when expand at Const temperature from Volume  $V_1$  to final Volume  $V_2$

$$\left(P + \frac{an^2}{V^2}\right)(V - nb) = nRT \rightarrow \text{Vander Vall equation}$$

As  $a$  &  $b$  Constant

$$P = \frac{nRT}{V - nb} - \frac{an^2}{V^2}$$

$$\therefore W = \int_{V_1}^{V_2} P \cdot dV = \int_{V_1}^{V_2} \left( \frac{nRT}{V - nb} - \frac{an^2}{V^2} \right) \cdot dV$$

$$= \int_{V_1}^{V_2} \frac{nRT}{V - nb} \cdot dV - \int_{V_1}^{V_2} \frac{an^2}{V^2} \cdot dV$$

$$= nRT \int_{V_1}^{V_2} \frac{dV}{V - nb} - an^2 \int_{V_1}^{V_2} V^{-2} \cdot dV$$

$$= nRT \ln[V - nb]_{V_1}^{V_2} - an^2 \left[ \frac{V^{-2+1}}{-2+1} \right]_{V_1}^{V_2}$$

$$= nRT \ln[V - nb]_{V_1}^{V_2} - an^2 \left[ \frac{V^{-1}}{-1} \right]_{V_1}^{V_2}$$

$$= nRT \ln[V - nb]_{V_1}^{V_2} + an^2 \left( \frac{1}{V} \right)_{V_1}^{V_2}$$

$$= nRT [\ln(V_2 - nb) - \ln(V_1 - nb)] + an^2 \left( \frac{1}{V_2} - \frac{1}{V_1} \right)$$

$$W = nRT \ln \frac{V_2 - nb}{V_1 - nb} + an^2 \left( \frac{1}{V_2} - \frac{1}{V_1} \right) \text{ For real gas}$$

Example find work done by 1 mole of chlorine when expands at Const temperature  $50^{\circ}\text{C}$  from Volume 1 L to final Volume 50 L

① if the chlorine act as ideal gas

② if the chlorine act as real gas  $a = 6.493$   
 $b = 0.05$

Solution

① if the chlorine act as ideal gas

$$W = nRT \ln \frac{V_2}{V_1}$$

$$W = (1) \left( 0.082 \frac{\text{L} \cdot \text{atm}}{\text{mole}^{\circ}\text{K}} \right) (50 + 273)^{\circ}\text{K} \ln \frac{50}{1}$$

$$W = 103.6 \text{ L} \cdot \text{atm}$$

② if the chlorine act as real gas

$$W = nRT \ln \left( \frac{V_2 - nb}{V_1 - nb} \right) + an^2 \left( \frac{1}{V_2} - \frac{1}{V_1} \right)$$

$$= (1 \text{ mole}) \left( 0.082 \frac{\text{L} \cdot \text{atm}}{\text{mole}^{\circ}\text{K}} \right) (50 + 273^{\circ}\text{K}) \ln \left( \frac{50 - 1(0.05)}{1 - 1(0.05)} \right) + 6.493 \left( \frac{1}{50} - \frac{1}{1} \right)$$

$$W = 98.747 \text{ L} \cdot \text{atm}$$

لاحظ الشغل المبذول في حالة الغاز الحقيقي أقل من حالة الغاز المثالي  
Work in Case of real gas  $\Rightarrow$  Work decrease

# Energy

① macroscopic  
All forms of energy  
outside the system  
تدرس كل الطاقات خارج النظام

② microscopic  
related to structure of  
molecules forming system

\* Internal energy (U) الطاقة الداخلية  
all sum of microscopic energy  
هي الطاقة المرتبطة بـ structure وانتقاله من مستوى لآخر وهكذا

\* kinetic energy (k.E) طاقة الحركة  
The energy that the system has due to its motion  
هي الطاقة التي يمتلكها النظام نتيجة حركته

$$k.E = \frac{1}{2} m v^2$$

↓  
mass الكتلة

→ velocity السرعة

\* Potential energy (P.E) طاقة الوضع  
The energy result of it's elevation in gravitational field  
هي الطاقة الناتجة عن ارتفاع الجسم في مجال الجاذبية الأرضية

$$P.E = m \cdot g \cdot z$$

↓  
mass الكتلة

↓  
g عجلة الجاذبية

→ elevation الارتفاع

Total energy = internal energy + kinetic energy + Potential energy

$$E = U + k.E + P.E$$

$$\Delta E = \Delta U + \Delta k.E + \Delta P.E$$

⊗ First Law of thermodynamics has three forms

1- Energy Can't be created or destroyed but it can transfer from one form to another.  
 ↳ law of Conservation of energy      قانون بقاء الطاقة  
 الطاقة لا تخلق ولا تدمر ولكن يمكن تحويلها من صورة لأخرى

2- Total amount of energy of system & surrounding are Constant  
 مجموع طاقتي النظام والمحيطة ثابتة

3- During the interaction between system & surrounding  
 (energy gained by the system) = (energy lost by the surrounding)  
 الطاقة المفقودة من الوسط = الطاقة المكتسبة للنظام والعكس صحيح

$$\Delta E = Q \pm W$$

As  $\Delta E \rightarrow$  net change in total energy      التغير في الطاقة الكلية  
 $Q \rightarrow$  heat gained (or) heat lost      مقدار الطاقة المكتسبة أو المفقودة  
 $W \rightarrow$  Work done on the system      الشغل المبذول على النظام  
 (or) Work done by the system      الشغل المبذول بواسطة النظام

But  $\Delta E = \Delta u + \Delta k.E + \Delta P.E$

neglect change in kinetic energy & Potential energy

$$\therefore \Delta E = \Delta u$$

$$\Delta u = Q \pm W$$

## first Law of thermodynamics

$$\Delta E = Q \pm W$$

$$\Delta E = Q + W$$

مستغل بالصورة دى فى المسائل

$$\Delta E = Q - W$$

مستغل بالصورة دى فى الإثباتات

ملحوظة

Q  $\rightarrow$  +ve "gained heat" اكتساب حرارة  
 $\rightarrow$  -ve "loss heat" فقد حرارة

W  $\rightarrow$  +ve "work done on system"  
 $\rightarrow$  -ve "work done by system"

فزان صلب

Ex | A rigid tank Contains hot fluid that is cooled while being stirred by a paddle wheel. The initial internal energy of the fluid is 800 kJ during the cooling process, the fluid losses 500 kJ of heat, and the paddle wheel does 100 kJ of work on fluid. Determine the final internal energy of the fluid ??  
 Neglect the energy stored in the paddle wheel

$$u_1 = 800 \text{ kJ}$$

$$Q = -500 \text{ kJ}$$

$$W = +100 \text{ kJ}$$

$$u_2 = ??$$

$$\Delta E = Q + W$$

$$\Delta E = -500 + 100 = -400 \text{ kJ}$$

$$\Delta E = \Delta u + \cancel{\Delta k} + \cancel{\Delta p}$$

neglect energy stored in Paddle wheel

$$\Delta E = \Delta u = u_2 - u_1$$

$$-400 = u_2 - 800$$

$$u_2 = -400 + 800$$

$$u_2 = +400 \text{ kJ}$$

## Net heat transefer at Constant Volume $q_v$

$$\Delta E = q - w$$

$$\Delta u = q - w$$

$$\text{But } w = \int_{v_1}^{v_2} p \cdot dv$$

$$\text{But } \Delta E = \Delta u + \cancel{\Delta K} + \cancel{\Delta P} \cdot E$$

$$\therefore \Delta E = \Delta u$$

at Const Volume

$$du = \text{Zero}$$

$$w = \text{Zero}$$

$$u_2 - u_1 \leftarrow \boxed{\therefore \Delta u = q_v}$$

Net change in internal energy = heat transefer at Const Volume  
 كمية الحرارة المنقولة عند حجم ثابت = محصلة التغير في الطاقة الداخلية

ملحوظة:  $q_v$  depend on initial and Final state of internal energy

## Net heat transefer at Constant pressure $q_p$

$$\Delta E = q - w$$

$$q = \Delta E + w$$

$$w = p \Delta v \quad \text{at Const pressure}$$

$$\Delta E = \Delta u$$

$$\text{عند ثبات الضغط} \quad \boxed{q_p = \Delta u + p \Delta v}$$

$$q_p = (u_2 - u_1) + p(u_2 - u_1)$$

$$q_p = u_2 - u_1 + pu_2 - pu_1$$

$$q_p = u_2 + pu_2 - (u_1 + pu_1)$$

$$q_p = H_2 - H_1$$

$$\boxed{q_p = \Delta H}$$

$$H = u + pu$$

heat Content  
 or  
 enthalpy

net change in enthalpy = net change in heat transefer at Const pressure  
 كمية الحرارة المنقولة عند ضغط ثابت = محصلة التغير في المحتوى الحراري

ملحوظة:  $q_p$  depend on initial and Final state of heat Content

## Enthalpy: $(H)$ المحتوى الحرارى

is thermodynamic quantity equivalent to heat content of system  
هي كمية ترموديناميكية مكافئة للمحتوى الحرارى للنظام

→ change in enthalpy associated to particular chemical process  
التغير في المحتوى الحرارى مرتبط جزئياً بالعملية الكيميائية

### (\*) Relation between $q_p$ & $q_v$ :

$$q_p = \Delta U + P\Delta V$$

$$q_p = \Delta U + W \Rightarrow \boxed{q_p = q_v + W}$$

$$\rightarrow \boxed{q_p > q_v}$$

$q_p$  is larger than  $q_v$  by work

ملحوظة هامة جداً

- at const Volume the increase in heat transfer  
→ go to increase in internal energy

$$\boxed{q_v = \Delta U}$$

- at const pressure the increase in heat transfer  
→ go to work

→ go to increase in internal energy

$$\boxed{q_p = \Delta U + W}$$
